Event Manager
User Guide

The program is run by starting the EventManager_Stiliyan_Tonev.exe.

On the first run the user will be greeted with a file choose option, the choosen file will be the file in which the events will be created it must be an existing file on the filesystem, if the user chooses to terminate the dialog a fail named "default0.save" is set as the save file and its directory is the same as the .exe file's.

The program has 4 main functions, create, delete, edit event and export saved events. All of them are found in the main user interface. The file where events are saved is writen in a file named ".eventmanage.conf" (this would allows easilly adding multi user suport) in the main directory (the same as where is the .exe). The file where the events are saved can is choosen by the user on the first run.

When opened the main user interface greets the use with a calendar widget and an empty list box, after a date is choosen the list box is filled with the events running during the given date.

When choosen the create function opens a new user interface presenting the options for creating a new event, name, location, date of start and of end. When the user fills the fields and chooses create option the event will is passed to the manager, in case it is already present, the user is notified about the fact.

In order to choose the delete option, the user must have choosen a given event/s from the presented list, after clicking delete the selected events are deleted from the manager.

In order to edit an event, it must be choosen from the presented list, after which the form for event creation is open with the previous event's data in the empty fields, after choosing edit option the event's properties will be changed.

After choosing export, the user is presented a form with a text field expecting him to enter the path/file where he wants the saved events to be exported.
